Submitted To – Mr. Manikandan J

Introduction

The *Procrastination Tracker* is a command-line based Python application designed to help users monitor and improve their daily study habits. It focuses on identifying productivity gaps by comparing planned study hours with actual hours spent studying. The project aims to encourage better time management and reduce procrastination through simple tracking and feedback.

Objective

The main objectives of this project are:

- To track daily study consistency
- To calculate productivity using a simple scoring system
- To provide meaningful feedback for improvement
- To help users identify patterns in their study behavior

Features

- Add and store daily study data
- View previously saved records
- Calculate productivity score
- Display analysis (average score, best day, worst day)
- Warn users about low productivity
- Option to clear stored data
- Interactive command-line interface

Technologies Used

- **Python** – Core programming language
- **JSON** – Used for storing and managing data

Methodology

The user inputs planned and actual study hours. The program calculates a productivity score based on performance. Data is stored in a JSON file for persistence. The system analyzes stored data to provide insights such as average productivity and performance trends.

Output / Result

The application successfully tracks user study habits and provides feedback such as:

- Productivity score (percentage)
- Motivational or warning messages
- Identification of best and worst performance days

Conclusion

The Procrastination Tracker is a simple yet effective tool for improving productivity. It helps users become more aware of their time usage and encourages disciplined study habits. The project is beginner-friendly and demonstrates practical use of Python concepts like file handling and data analysis.

Future Enhancements

- Add graphical visualization of progress
- Build a GUI version of the application
- Add reminders and notifications
- Include weekly/monthly reports
